RULE · Percent change (foiz o'zgarishi)

$$\frac{N - O}{O} \times 100\%$$

N = new value, O = original value – always divide by the **original**, never the new value.

\$40 → \$52: $\frac{52 - 40}{40} = 30\%$ increase

RULE · Multiplier method (ko'paytuvchi usuli)

$$N = O \times (1 \pm r)$$

r = percent as a decimal. + for increase, − for decrease.

\$150, +20%: $150 \times 1.20 = \$180$

RULE · Successive percent changes

Each change applies to the **previous result**, not the original.

$$O \times (1 + r_1) \times (1 - r_2)$$

\$500, +20% then −10%: $500 \times 1.20 \times 0.90 = \$540$ (net +8%, not +10%)

Percent changes never add or subtract directly – multiply the factors.
