RULE · Mean, median, mode (o'rta qiymatlar)

Measure	Rule
Mean	sum ÷ count
Median	middle value, sorted – odd count: middle; even count: average of the two middle values
Mode	most frequent value

RULE · Weighted mean (combining groups)

$$\text{Combined mean} = \frac{\text{sum}_A + \text{sum}_B}{\text{count}_A + \text{count}_B}$$

Not $\frac{\text{mean}_A + \text{mean}_B}{2}$ – unless the two groups are the same size.

8 students, mean 70; 12 students, mean 90: $\frac{8(70) + 12(90)}{8 + 12} = \frac{1640}{20} = 82$

RULE · Range & outlier sensitivity

$$\text{range} = \max - \min$$

An outlier pulls the mean strongly; the median barely moves – it depends only on sorted position, not size.

$\{4, 5, 6, 7, 8\}$, mean = 6, median = 6. Add 50: mean ≈ 13.33, median = 6.5.
