RULE · Frequency table (chastota jadvali)

Total = sum of all frequencies. Percent of a category = $\frac{\text{count}}{\text{total}} \times 100\%$.

18 of 50 students: $\frac{18}{50} \times 100\% = 36\%$

RULE · Two-way table – pick the right denominator

	Basketball	Volleyball	Row total
Girls	14	26	**40**
Boys	33	17	**50**
Col. total	**47**	**43**	**90**

"% of girls" → denominator = girls' row total. "% of volleyball choosers" → denominator = volleyball's column total.

% of girls who chose volleyball: $\frac{26}{40} \times 100\% = 65\%$

% of volleyball choosers who are girls: $\frac{26}{43} \times 100\% \approx 60.5\%$

Same number (26), different denominator, different answer – read the question's word order carefully.

RULES SHEET – 2/2

RULE · Scatterplot – correlation

Pattern	Correlation
Points trend up, left to right	Positive
Points trend down, left to right	Negative
No clear up/down trend	None

Points rise left to right → **positive correlation**.

SAT asks for the relationship in words ("strong positive," "weak negative," "no correlation"), not an *r*-value formula.

Correlation is not causation – a trend between two quantities does not prove one causes the other.
